

ATTADALE CHIROPRACTIC NEWSLETTER

MAKING THE MOST OF 2010

KEEPING 'IN ADJUSTMENT' IS LARGELY A MATTER OF WISE CHOICES. GETTING OUT OF ADJUSTMENT IS OFTEN THE RESULT OF UNWISE CHOICES.

Chiropractic utilises the power that made the body and that heals the body.

Locating and adjusting subluxations assists the body's inborn intelligence to restore normal function.

Making use of that lifetime potential is optional.

Simply Put

I was asked "Do our patients understand the subluxation concept?"

Most patients experience some form of nerve interference symptom/s.

When we find that their joint motion is restricted, the area feels tender.

Patients often identify joints that have lost their normal position.

A bone out of place, stuck joints and nerve interference sums up a subluxation

How ancient are subluxation related symptoms

At the very dawn of humanity our common forebears had brains, spines, spinal cords and spinal nerves. There would have been the capacity that when they exceeded their spine's stress bearing tolerance, their fail safe mechanism would come into play and create subluxation related symptoms.

That mechanism existed throughout succeeding generations, regardless of, if humans did or did not, develop a competence to locate and correct those faults. Even today, most humans have not experienced having their subluxations located and adjusted.

Remarkably, over 100 years ago D. D. Palmer demonstrated that hearing may be impaired by a subluxation interfering with the nerve supply between the brain and the ear. Since that time chiropractors have worked with that power that governs function.

Subluxation related symptoms may invite a referral by a chiropractic patient.

I meet many non-active chiropractic patients who tell me that they felt better when they had regular chiropractic care and that they have been meaning to get adjusted.

This is where giving your chiropractor a call comes in.

A body that is free of nerve interference has more power to heal, think and metabolize. Ninety percent of the stimulation and nutrition to the brain is generated by movement of the spine.

- Roger W. Sperry, PhD 1981 Nobel Laureate for Medicine

How many humans have acquired and retained subluxation related symptoms?

Most humans would not have had the privilege of recognising and remedying their subluxation related disorders. Of all humanity, we exceptions are among the privileged few.

The Century Long Battle Goes On

Babies, infants and children should have access to chiropractic care.

SURVEY

I am asking patients to assist in an informal survey by selecting 10 acquaintances, who are not relatives, and asking them the following question:

Are you currently attending, or have you ever attended a chiropractor?

Using numerous blocks of 10 we may accumulate a credible number of responses.

Murdoch University graduates upwards of fifty new chiropractors per year. Hence it is essential that the % of the community receiving chiropractic care keep pace with that increase.

If you wish to assist us in this project please convey your data back to us as soon as practical; 93305298 or michael.mckibbin@attadalechiropractic.com

Dogs make very interesting patients. Their owners are very appreciative of the improvements that they observe.

The dog owners and I can observe what occurs coincidental to subluxations being located and adjusted.

The suggestion that patients imagine improvement, that chiropractic creates a placebo effect would not apply to dogs.

For me, adjusting a few four footed friends is a nice way to end a practice session.

Best wishes from

Michael McKibbin and staff
